PROFESSIONAL SUMMARY

Backend engineer with nearly three years building transaction-heavy systems for banks and health insurers in Nigeria, Liberia and Tanzania. Lead backend engineer on an HMO platform serving 100,000+ enrollees; designed and built Account Mapper, a banking integration live with 10+ partner institutions. I work on the parts that have to be right: ledgers, concurrency, audit trails and integrations with banks and card processors. Co-founder and CTO of innKorp.

PROFESSIONAL EXPERIENCE

Backend Engineer | Inlaks | *March 2024 – Present*

C#, ASP.NET Core, SQL Server, Redis, MongoDB, Hangfire, IIS

Health insurance (HMO) platform · Nigeria

- Lead backend engineer on the platform a Nigerian health insurer runs on, serving 100,000+ enrollees: member onboarding, provider networks, claims vetting and subscription billing for corporate and retail clients.
- Replaced a mutable balance model with an append-only consumption ledger, with concurrency-safe writes and balance reconciliation, ending the data drift behind failed reconciliations.
- Built a transactional outbox with idempotency keys and parallel dispatch, so audit events are never lost or duplicated.
- Ended duplicate enrollee and provider numbers by moving ID generation to database-backed counters with unique indexes.
- Owned claims vetting: replaced hardcoded roles with a permission-based model, added self-assignment workflows and richer audit trails.
- Moved bulk enrollee uploads to a validated, asynchronous job pipeline, ending the request timeouts that created duplicate records. Added tests around ledger invariants, ID generation and bulk validation.

Account Mapper · Liberia

- Designed and built Account Mapper, a shared account-lookup and name-enquiry service for Liberian banks, now live with 10+ partner institutions.
- Raised ingestion throughput by 40% by parallelising SFTP ingestion per partner, caching partner lookups and removing redundant database scans.
- Redesigned the data model for multi-currency accounts and moved bulk processing and audit logging onto Hangfire queues, so failures are retried and visible.
- Led a security review covering tenant isolation, authorisation checks and encryption of name-enquiry payloads; built the automated test foundation and input validation on every entry point.
- Acted as technical liaison between the banks' ICT teams and implementation vendors, resolving ambiguous integration requirements before cutover.

Corporate internet banking · Tanzania

- Lead the backend for a bank's corporate internet banking: web and mobile channels plus a staff back office, live for the bank's business customers.
- Wrote the integration guide client teams build against, updated in the same pull request as the code.

Co-founder & CTO | innKorp | *2026 – Present*

TypeScript, Next.js, PostgreSQL (Supabase), Vercel

- Co-founded innKorp, a KYC vault that small businesses own: they complete verification once and share it with fintechs on their own terms. Currently in pilot; I run all of the technology.

Backend Developer | CoreInfra (formerly Mercator) | *November 2023 – March 2024*

C#, ASP.NET Core, ASP.NET MVC, SQL Server, Docker, IIS

- Built REST APIs and data services for a prepaid-card platform processing 10,000+ transactions a day, under strict accuracy and fraud-prevention requirements.
- Integrated card creation with the card processor, so cards are issued through the platform's API.
- Built transaction monitoring: real-time alerts on flagged transactions and a dashboard for staff to review them.
- Implemented JWT/OAuth2 authentication and containerised the stack with Docker.

EDUCATION

B.Sc (Hons) Systems Engineering | *University of Lagos, Nigeria* | *March 2023*

Fintech Innovations Specialisation | *Coursera / University of Michigan* | *August 2024*

TECHNICAL SKILLS

Languages & frameworks: C#, ASP.NET Core, Entity Framework Core, SQL, TypeScript, Next.js, Bash

Data & jobs: SQL Server, PostgreSQL, MongoDB, Redis, Hangfire

Integration: REST, OpenAPI / Swagger, SFTP, card processor APIs, JWT / OAuth2

Practices & tooling: Append-only ledgers, transactional outbox, idempotency, concurrency control, Docker, IIS, xUnit, NUnit
