EXPERIENCE

Inlaks — Backend Engineer

March 2024 – Present

Health insurance (HMO) platform · Nigeria

- Lead the backend of the platform a Nigerian health insurer runs on, serving 100,000+ enrollees across onboarding, provider networks, claims vetting and billing.
- Replaced a mutable balance model with an append-only ledger and concurrency-safe writes, ending the data drift behind failed reconciliations.
- Built a transactional outbox with idempotency keys and parallel dispatch, so audit events are never lost or duplicated.
- Ended duplicate enrollee and provider numbers with database-backed ID counters, and moved bulk uploads to a validated asynchronous job pipeline.
- Owned claims vetting: replaced hardcoded roles with a permission-based model, self-assignment workflows and richer audit trails.

Account Mapper · Liberia

- Designed and built a shared account-lookup and name-enquiry service for Liberian banks, live with 10+ partner institutions.
- Raised ingestion throughput by 40% by parallelising SFTP ingestion per partner, caching lookups and removing redundant database scans.
- Led a security review covering tenant isolation, authorisation and payload encryption, and built the automated test foundation.
- Acted as technical liaison between the banks' ICT teams and implementation vendors, resolving integration requirements before cutover.

Corporate internet banking · Tanzania

- Contribute to the architecture of a bank's corporate internet banking (web, mobile and a staff back office), working closely with the lead backend engineer. Live for the bank's business customers.
- Wrote the integration guide client teams build against, updated in the same pull request as the code.

innKorp — Co-founder & CTO

2026 – Present

- Co-founded a KYC vault that small businesses own: they verify once and share it with fintechs on their own terms. Currently in pilot.
- Run all of the technology, built on Next.js, TypeScript and PostgreSQL (Supabase).

CoreInfra (formerly Mercator) — Backend Developer

November 2023 – March 2024

- Built REST APIs and data services for a prepaid-card platform processing 10,000+ transactions a day, under strict accuracy and fraud-prevention requirements.
- Integrated card creation with the card processor, so cards are issued through the platform's API.
- Built transaction monitoring: real-time alerts on flagged transactions and a dashboard for staff to review them.
- Implemented JWT/OAuth2 authentication and containerised the stack with Docker.

EDUCATION

University of Lagos — B.Sc. (Hons) Systems Engineering

March 2023

SKILLS

C# | ASP.NET Core | Entity Framework Core | SQL Server | PostgreSQL | MongoDB | Redis | Hangfire | TypeScript | Next.js | Docker | REST / OpenAPI | JWT / OAuth2 | xUnit | NUnit

HONORS & AWARDS

HNG Internship 9 — Finalist and team lead: top 300 of 11,000 participants

December 2022

CERTIFICATIONS

Coursera / University of Michigan — Fintech Innovations Specialisation

August 2024
